Bus Management System

- Introduction

- College Bus Management System is developed using C++ language.
- It is used to manage bus details and student registrations.
- The project uses Linked List for storing bus information dynamically.
- It provides functions to display buses, add members, and search student details.
-

Objective

- Manage bus details easily
- Register students to buses
- Search student bus information
- Implement Linked List in C++

Technology Used

- C++
- Linked List
- Structures
- Functions

Main Functions

- `Insert buses()` – Add bus details
- `Load buses()` – Load default buses
- `Add members()` – Register student
- `display()` – Show buses and stops
- `View details()` – Search student details

Linked List Concept

- Linked List stores data using nodes.
- Each node contains data and a next pointer.
- Bus details are stored as nodes in this project.
- It allows dynamic memory allocation and easy insertion.

Future Enhancements

- Add database support
- Create GUI interface
- Add GPS tracking
- Multiple student registrations

Advantages

- Easy data management
- Dynamic memory usage
- Simple searching process
- Easy to modify

Disadvantages

- Data is not stored permanently after closing the program.
- The system supports only limited features.
- No graphical user interface (GUI) is available.
- Only basic student and bus details can be managed.

Conclusion

This project helps manage bus information efficiently and improves understanding of Linked List implementation in C++.

Thank You...>
